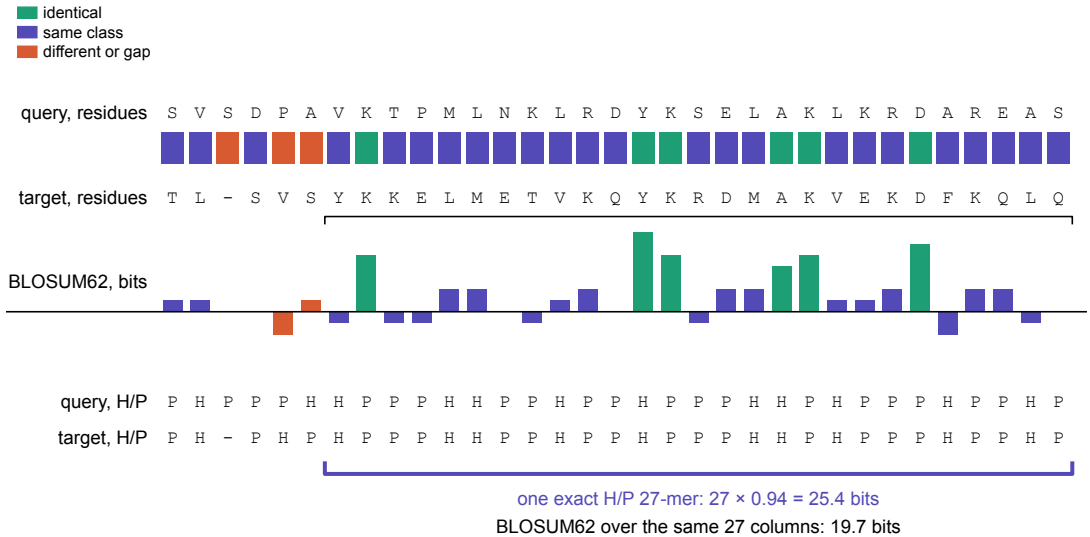
TOOLS: no kmerseek; Pfam-A 38.2 seed alignment of PF05008 (V-SNARE), BLOSUM62 (Biopython), hp_thomas_dill2 classes
V-SNARE: 27 columns keep their H/P class, 6 residues are identical; the exact H/P run is worth 25.4 bits, BLOSUM62 gives 19.7



Hypothesis: If BLOSUM62 saw what the H/P run sees, its bars would be tall across the whole run, not only at the identical residues.
Conclusion: A4RVZ0_OSTLU/1-94 residues 68-94 against A0BIB1_PARTE/7-98 residues 72-98: the H/P run carries 25.4 bits at this pair's chance match rate of 0.52 per position; the 6 identical residues carry most of BLOSUM62's 19.7 bits. Section 4 scores the whole domains with a gapped aligner.
