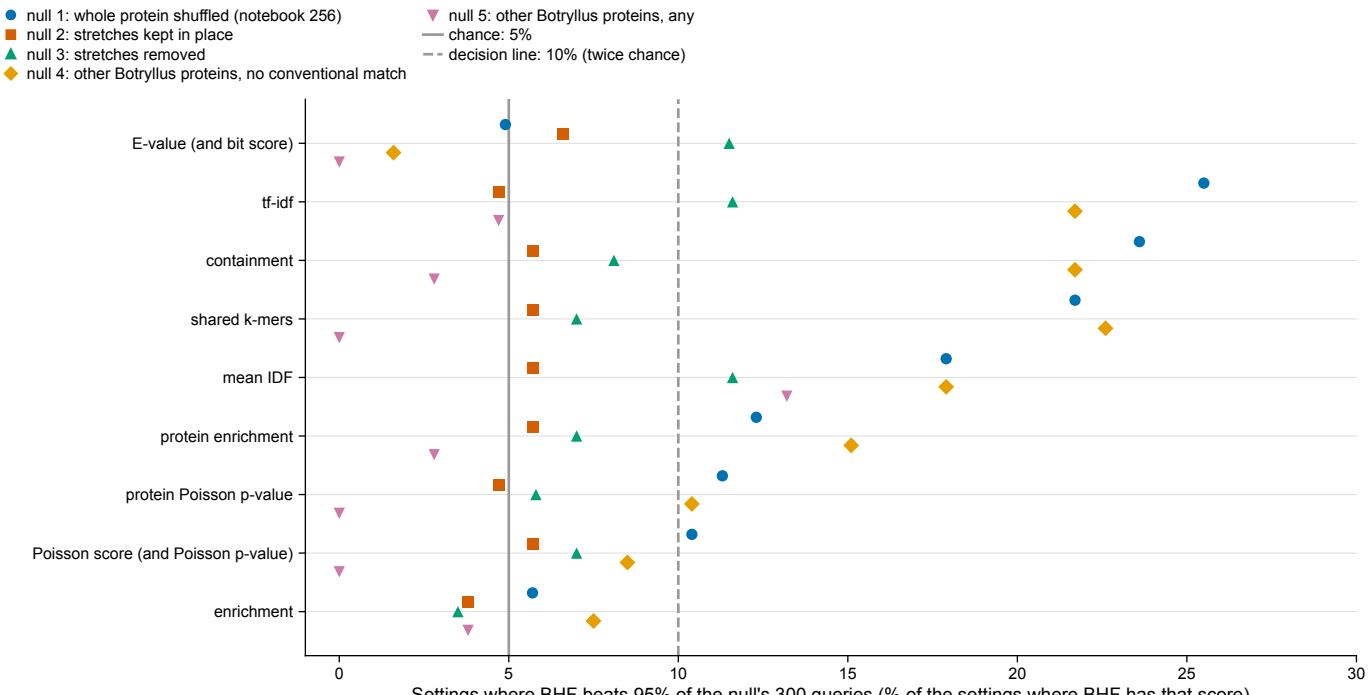
kmerseek 0.4.0 (982a055): BHF and 300 copies or other proteins per null searched against 19_732 GENCODE v49 human proteins at the 152 settings (alphabet, k) of notebook 241.

Hypothesis: if BHF's wins come from its low-complexity stretches, copies that keep the stretches (null 2) bring every score back to the 5% chance line.


Conclusion: 0 of 9 scores beat null 2 in more than twice the settings chance predicts. Against other Botryllus proteins (nulls 4, 5) the E-value stays at chance; null 4's wins sit on the same stretches.
