

Human proteome, about 100 proteins per seed **Swiss-Prot 2026_03, 1 chance match**

◆ k_{100} , measured ● k^* , predicted
 ○ k_{100} , predicted ● $k_{\max}$, predicted

■ ■ ■ one cell per k-size to test, $k_{\min}$ to $k_{\max}$; # k-sizes at right counts them
 Predicted: $k = \lceil \log_2(N/\text{matches})/B \rceil$, the shortest k with at most that many chance matches in N residues
 B, bits per letter: from Swiss-Prot composition; for $k_{\max}$, measured in the human proteome
