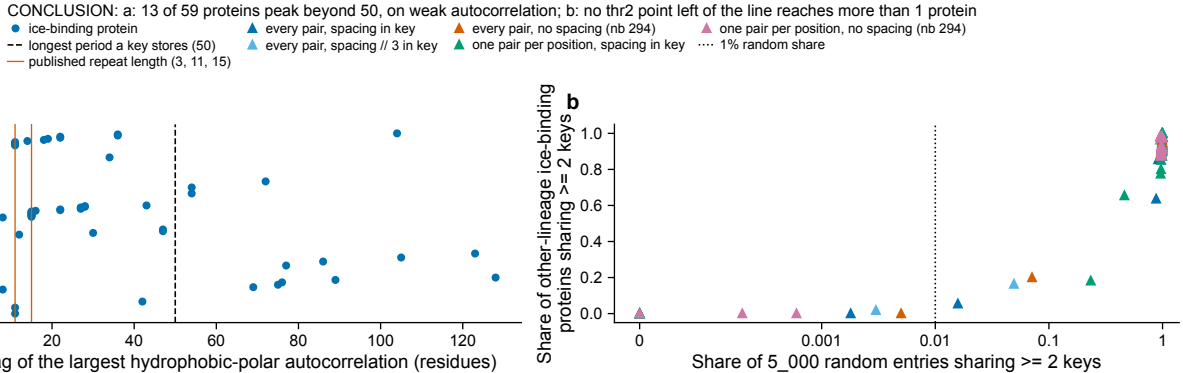
TOOLS: a: 59 reviewed ice-binding proteins, Swiss-Prot 2026_03; b: thr2 (T against every other residue), 25 settings x 6 real queries, linked word pairs counted directly

HYPOTHESIS: a: repeat periods sit within what a key can store; b: some thr2 key reaches ice-binding proteins while staying left of the 1% line


CONCLUSION: a: 13 of 59 proteins peak beyond 50, on weak autocorrelation; b: no thr2 point left of the line reaches more than 1 protein
