TOOLS: linked word pairs counted directly; mean over the 6 real ice-binding queries; 5_000 random entries of Swiss-Prot 2026_03 (575_748 entries)
HYPOTHESIS: a key family keeps chance matches rare while words are still short
CONCLUSION: under 1% only: 20 amino acids with 4-letter words (or 3 letters, one pair per position), Dayhoff with 5-6 letters and hydrophobic-polar with 10 letters, both one pair per position with the spacing in the key; notebook 294's key (ringed) is shared 2 or more times by 95% of random entries
