TOOLS: setting protein20, words of 4, every pair, spacing // 3 in key; keys whose spacing is equal in both proteins; Swiss-Prot 2026_03
HYPOTHESIS: a shared key between relatives sits in a stretch similar along its whole length
CONCLUSION: the bacterial query's five fungal targets (its own UniProt family) are 48 to 100% identical over each stretch; the type I and AFGP pair, both alanine-rich, 46 to 48%. Pairs whose spacing differs (the AFGP query, P05140) have no equal-length stretch
