TOOLS: shared distinct k-mers counted directly, k = 3 to 40, in 8 kmerseek alphabets; 75 counted shell-matrix targets; random sample from reviewed Swiss-Prot 2026_03
HYPOTHESIS: some alphabet and k reaches shell-matrix targets of other lineages better than the composition rule that defined them (a point above and left of the star)
CONCLUSION: the composition rule reaches every target at 0.045 of random proteins; the best k-mer setting at that cost reaches 37 of 72
