TOOLS: query mussel foot protein 1 (Q25460, Mytilus edulis); target reviewed Swiss-Prot 2026_03 plus 3 TrEMBL cement entries; kmerseek 0.4 (3c353d4), 230 settings; phmmer, jackhmmer, MMseqs2, Foldseek, and scans with no search

HYPOTHESIS: a method that reads the shared glue pattern ranks the sandcastle worm cement proteins near 0 in panel a and the barnacle control far right; lower is better

CONCLUSION: no kmerseek setting and no sequence tool reports a worm or barnacle protein at all; 39 of 230 kmerseek settings put both Mytilus foot protein 1 entries first with an E-value, as every sequence tool does
