in this repository
not available, so nothing downstream can be measured
Input
What is run on it
What comes out
200 historical construct submissions: intended protein, received protein, resolved discrepancy record
Facility DNA calls (VecScreen or its own)
Recorded review minutes per batch
Frozen tag and linker list: 12 sequences, with a source and a checksum for each + 6 clean Swiss-Prot host proteins
Exact tag match (protein20)
Local alignment (BLOSUM62)
Facility DNA check
kmerseek reduced alphabet (the piece under test): shared reduced k-mers
Mechanics check on constructs built here (does not count)
Thresholds 1-3: inserts recovered, false flags per 100 clean, errors the comparison workflow missed NOT MEASURABLE
Threshold 4: review time per batch NOT MEASURABLE
What this notebook does deliver: the pass rule, the data contract, the frozen tag list, working code, and the mechanics check
